

Canada Pipeline Project Work

PIPE LINE CONTRACTORS
ASSOCIATION OF CANADA

The Canada Pipeline Project Work report highlights various Canadian pipeline construction projects, recently completed, under construction, and future projects announced by pipeline transmission companies operating in Canada.

Mainline Pipeline Construction refers to projects with pipelines up to 48 inches in diameter that transport high pressure natural gas and petroleum products to and from processing facilities, wellheads, refineries and storage facilities to downstream customers across the country.

Mid-Inch Pipeline Construction refers to pipelines predominately operating within the midstream pipeline sector. These pipelines generally operate at both high and low pressures, ranging from 6 inches to 24 inches in diameter.

Distribution Pipeline Construction refers to pipelines that are typically 6 inches or less in diameter that operate at lower pressures than mainline pipelines used in the distribution of gas, oil and other products downstream from metering stations to stations or meters within the industrial, commercial and residential markets.

Pipeline Maintenance and Service refers to the work done to maintain the integrity of various pipelines through various techniques such as repair, re-coating, non-destructive testing and removal.
